

Steps of the water cycle

Cut out the steps. Glue them in order to show how water moves around and around.

Glue the steps in order. Step 1 is done for you.

1 The sun warms the water in lakes and oceans.	2	3
4	5	6

✂ Cut out steps 2 to 6 along the dotted lines.

The droplets join, grow heavy and fall as rain or snow.	High in the sky, the vapour cools and condenses into tiny droplets.	The water runs off the land into rivers that carry it back to the lake.
The warm water evaporates and rises into the air as water vapour.	Millions of droplets gather together and form clouds.
